AMENDMENTS TO THE CLAIMS

1. (ORIGINAL) A method in a server configured for executing web-based voice application operations, the method comprising:

receiving a first hypertext markup language (HTML) request, via a hypertext transport (HTTP) connection, for execution of a first web-based voice application operation for a first user;

first storing in a data record a session identifier and a first application state that specifies an execution by a first application instance of the first web-based voice application operation for the first user;

executing a second web-based voice application operation by a second application instance for a second user based on the execution of the first web-based voice application operation for the first user; and

second storing in the data record a second application state that specifies the execution by the second application instance of the second web-based voice application operation for the second user.

- 2. (ORIGINAL) The method of claim 1, wherein the first storing step and the second storing step each include storing user attribute information that specifies attributes about the corresponding user in the data record.
 - 3. (ORIGINAL) The method of claim 1, further comprising:

Amendment filed August 26, 2004 Appln. No. 09/538,899

Page 4

executing a third web-based voice application operation in response to reception of a second HTML request from a first browser serving the first user and based on the first

application state stored in the data record; and

overwriting the first application state stored in the data record with a third application

state that specifies the execution of the third web-based voice application operation for the first

user.

4. (ORIGINAL) The method of claim 3, wherein the step of executing the third web-

based voice application operation includes outputting for the first user an HTML page having

extensible markup language (XML) tags that specify a group of menu options selectable by the

first user and at least one media file to be played for the first user.

5. (ORIGINAL) The method of claim 3, wherein the step of executing the third web-

based voice application operation includes:

initiating a third application instance in response to reception of the second HTML

request;

accessing by the third application instance the data record based on detecting the session

identifier within the second HTML request; and

selecting for execution a stored XML document that specifies the third web-based voice

application operation, based on identifying the HTML request by the first user and based on the

first application state stored in the data record.

6. (ORIGINAL) The method of claim 3, further comprising:

receiving via the HTTP connection a third HTML request from a second browser serving

the second user;

executing a selected fourth web-based voice application operation in response to the third

HTML request and based on the second application state stored in the data record; and

selectively storing in the data record fourth and fifth application states for the first and

second users, respectively, based on execution of the selected fourth web-based voice application

operation.

7. (ORIGINAL) The method of claim 6, wherein the step of executing the selected fourth

web-based voice application operation includes sending XML tags specifying a bridge command

to at least one of the first and second browsers for bridging the first and second users based on

detection of a prescribed command within the third HTML request, the selectively storing step

including specifying within the data record the fourth and fifth application states based on

sending the bridge command.

8. (ORIGINAL) The method of claim 6, wherein the step of executing the selected fourth

web-based voice application operation includes outputting to the first user a second HTML page

having XML tags that specify a record operation for recording a message, the selectively storing

step including specifying as the fourth application state a leave-message operation, and specifying as the fifth application state an unavailability of the second user.

- 9. (ORIGINAL) The method of claim 1, further comprising generating the data record as an XML document configured for storing a plurality of application states for respective users according to the session identifier, the first storing step including storing a first subsession identifier for the first user, and storing a second subsession identifier for the second user.
- 10. (ORIGINAL) The method of claim 9, further comprising selectively executing respective web-based voice application operations independently for the first and second users based on respective HTML requests received from the first and second users and the first and second application state stored in the data record.
- 11. (ORIGINAL) The method of claim 10, wherein the selectively executing step includes executing a selected voice application operation for requesting bridging of the first and second users based on a prescribed HTML request received from the second user, the method further comprising third storing in the data record a third application state for the first and second users specifying the bridging.
- 12. (ORIGINAL) The method of claim 11, wherein the selectively executing step further includes executing a second selected voice application operation for requesting disconnection of

Amendment filed August 26, 2004 Appln. No. 09/538,899 Page 7 the bridging based on a second prescribed HTML request received from an HTML browser

serving one of the first and second users and the stored third application state, the method further

comprising fourth storing in the data record a fourth application state for the first and second

users specifying the disconnection of the bridging.

13. (ORIGINAL) The method of claim 12, further comprising selectively executing a

second group of respective web-based voice application operations independently for the first

and second users based on respective HTML requests received from the first and second users

and the fourth application state stored for the first and second users in the data record.

14. (ORIGINAL) The method of claim 1, further comprising controlling write access to

the data record by one of the first and second application instances based on prescribed

read/write protocol within the server.

15. (ORIGINAL) A computer readable medium having stored thereon sequences of

instructions for executing web-based voice application operations by a server, the sequences of

instructions including instructions for performing the steps of:

receiving a first hypertext markup language (HTML) request, via a hypertext transport

(HTTP) connection, for execution of a first web-based voice application operation for a first user;

first storing in a data record a session identifier and a first application state that specifies

an execution by a first application instance of the first web-based voice application operation for

the first user;

executing a second web-based voice application operation by a second application

instance for a second user based on the execution of the first web-based voice application

operation for the first user; and

second storing in the data record a second application state that specifies the execution by

the second application instance of the second web-based voice application operation for the

second user.

16. (ORIGINAL) The medium of claim 15, wherein the first storing step and the second

storing step each include storing user attribute information that specifies attributes about the

corresponding user in the data record.

17. (ORIGINAL) The medium of claim 15, further comprising instructions for

performing the steps of:

executing a third web-based voice application operation in response to reception of a

second HTML request from a first browser serving the first user and based on the first

application state stored in the data record; and

overwriting the first application state stored in the data record with a third application

state that specifies the execution of the third web-based voice application operation for the first

user.

18. (ORIGINAL) The medium of claim 17, wherein the step of executing the third web-

based voice application operation includes outputting for the first user an HTML page having

extensible markup language (XML) tags that specify a group of menu options selectable by the

first user and at least one media file to be played for the first user.

19. (ORIGINAL) The medium of claim 17, wherein the step of executing the third web-

based voice application operation includes:

initiating a third application instance in response to reception of the second HTML

request;

accessing by the third application instance the data record based on detecting the session

identifier within the second HTML request; and

selecting for execution a stored XML document that specifies the third web-based voice

application operation, based on identifying the HTML request by the first user and based on the

first application state stored in the data record.

20. (ORIGINAL) The medium of claim 17, further comprising instructions for

performing the steps of:

receiving via the HTTP connection a third HTML request from a second browser serving

the second user;

executing a selected fourth web-based voice application operation in response to the third

HTML request and based on the second application state stored in the data record; and

selectively storing in the data record fourth and fifth application states for the first and

second users, respectively, based on execution of the selected fourth web-based voice application

operation.

21. (ORIGINAL) The medium of claim 20, wherein the step of executing the selected

fourth web-based voice application operation includes sending XML tags specifying a bridge

command to at least one of the first and second browsers for bridging the first and second users

based on detection of a prescribed command within the third HTML request, the selectively

storing step including specifying within the data record the fourth and fifth application states

based on sending the bridge command.

22. (ORIGINAL) The medium of claim 20, wherein the step of executing the selected

fourth web-based voice application operation includes outputting to the first user a second

HTML page having XML tags that specify a record operation for recording a message, the

selectively storing step including specifying as the fourth application state a leave-message

operation, and specifying as the fifth application state an unavailability of the second user.

23. (ORIGINAL) The medium of claim 15, further comprising instructions for performing the step of generating the data record as an XML document configured for storing a plurality of application states for respective users according to the session identifier, the first storing step including storing a first subsession identifier for the first user, and storing a second

subsession identifier for the second user.

24. (ORIGINAL) The medium of claim 23, further comprising instructions for performing the step of selectively executing respective web-based voice application operations

independently for the first and second users based on respective HTML requests received from

the first and second users and the first and second application state stored in the data record.

25. (ORIGINAL) The medium of claim 24, wherein the selectively executing step

includes executing a selected voice application operation for requesting bridging of the first and

second users based on a prescribed HTML request received from the second user, the method

further comprising third storing in the data record a third application state for the first and second

users specifying the bridging.

26. (ORIGINAL) The medium of claim 25, wherein the selectively executing step further

includes executing a second selected voice application operation for requesting disconnection of

the bridging based on a second prescribed HTML request received from an HTML browser

serving one of the first and second users and the stored third application state, the method further

comprising fourth storing in the data record a fourth application state for the first and second

users specifying the disconnection of the bridging.

27. (ORIGINAL) The medium of claim 26, further comprising instructions for

performing the step of selectively executing a second group of respective web-based voice

application operations independently for the first and second users based on respective HTML

requests received from the first and second users and the fourth application state stored for the

first and second users in the data record.

28. (ORIGINAL) The medium of claim 15, further comprising instructions for

performing the step of controlling write access to the data record by one of the first and second

application instances based on prescribed read/write protocol within the server.

29. (ORIGINAL) A processor-based system configured for executing web applications,

the system comprising:

a hypertext transport protocol (HTTP) interface configured for receiving first and second

hypertext markup language (HTML) requests by first and second users, respectively, and sending

via an HTTP connection first and second HTML pages having a same session identifier and first

and second subsession identifiers to browser instances serving the first and second users,

respectively; and

an application server configured for executing first and second web application instances

for generation of the first and second HTML pages in response to the first and second HTML

requests, respectively, the application server storing a data record that specifies a session state, a

first subsession state for the first user based on execution of the first web application instance,

and a second subsession state for the second user upon completion of the second web application

instance, the application server accessing the data record in response to detecting the session

identifier in a subsequent HTML request from one of the first and second users, and executing a

selected web application operation based on at least one of the first and second subsession states

in the accessed data record.

30. (ORIGINAL) The system of claim 29, wherein the HTTP interface includes a web

server connected to an Internet Protocol (IP) network.

31. (ORIGINAL) The system of claim 29, further including a local memory for storing

the data record for a prescribed time interval.

32. (ORIGINAL) The system of claim 29, further comprising a shared registry for storing

the data record, the shared registry configured for supplying the data record to authorized servers.

33. (ORIGINAL) The system of claim 29, wherein the application server is configured

for storing within the data record attribute information that specifies respective attributes about

the first and second users, the application server executing the selected web application operation

based on the user attribute information in the corresponding accessed data record.

34. (ORIGINAL) The system of claim 33, wherein the application server stores the data

record as an extensible markup language (XML) document.

35. (NEW) The method of claim 1, further comprising:

terminating the first application instance based on completion of the first web-based voice

application operation by the first application instance; and

terminating the second application instance based on completion of the second web-based

voice application operation by the second application instance.

36. (NEW) The medium of claim 15, further comprising instructions for performing the

steps of:

terminating the first application instance based on completion of the first web-based voice

application operation by the first application instance; and

terminating the second application instance based on completion of the second web-based

voice application operation by the second application instance.

37. (NEW) The system of claim 29, wherein the application server further is configured

for:

terminating the first application instance based on completion of the first web-based voice

application operation by the first application instance; and

terminating the second application instance based on completion of the second web-based

voice application operation by the second application instance.

38. (NEW) A system configured for executing web-based voice application operations,

the system comprising:

first means for receiving a first hypertext markup language (HTML) request, via a

hypertext transport (HTTP) connection, for execution of a first web-based voice application

operation for a first user; and

second means for:

(1) first storing in a data record a session identifier and a first application state that

specifies an execution by a first application instance of the first web-based voice application

operation for the first user,

(2) executing a second web-based voice application operation by a second application

instance for a second user based on the execution of the first web-based voice application

operation for the first user, and

(3) second storing in the data record a second application state that specifies the execution

by the second application instance of the second web-based voice application operation for the

second user.

39. (NEW) The system of claim 38, wherein the second means is configured for storing

user attribute information in the data record that specifies attributes about each corresponding

user in the data record.

40. (NEW) The system of claim 38, wherein the second means is further configured for:

executing a third web-based voice application operation in response to reception of a

second HTML request from a first browser serving the first user and based on the first

application state stored in the data record; and

overwriting the first application state stored in the data record with a third application

state that specifies the execution of the third web-based voice application operation for the first

user.

41. (NEW) The system of claim 40, wherein the second means is configured for

executing the third web-based voice application operation based on outputting for the first user

an HTML page having extensible markup language (XML) tags that specify a group of menu

options selectable by the first user and at least one media file to be played for the first user.

42. (NEW) The system of claim 40, wherein the second means is configured for

executing the third web-based voice application operation based on:

initiating a third application instance in response to reception of the second HTML

request;

accessing by the third application instance the data record based on detecting the session

identifier within the second HTML request; and

selecting for execution a stored XML document that specifies the third web-based voice

application operation, based on identifying the HTML request by the first user and based on the

first application state stored in the data record.

43. (NEW) The system of claim 40, wherein:

the first means is configured for receiving via the HTTP connection a third HTML

request from a second browser serving the second user;

the second means is configured for executing a selected fourth web-based voice

application operation in response to the third HTML request and based on the second application

state stored in the data record, the second means selectively storing in the data record fourth and

fifth application states for the first and second users, respectively, based on execution of the

selected fourth web-based voice application operation.

44. (NEW) The system of claim 43, wherein the second means is configured for

executing the selected fourth web-based voice application operation based on sending XML tags

specifying a bridge command to at least one of the first and second browsers for bridging the first

and second users based on detection of a prescribed command within the third HTML request,

the second means configured for specifying within the data record the fourth and fifth application states based on sending the bridge command.

45. (NEW) The system of claim 43, wherein the second means is configured for executing the selected fourth web-based voice application operation based on outputting to the first user a second HTML page having XML tags that specify a record operation for recording a message, the second means configured for specifying as the fourth application state a leave-message operation, and specifying as the fifth application state an unavailability of the second user.

46. (NEW) The system of claim 38, wherein the second means is configured for generating the data record as an XML document configured for storing a plurality of application states for respective users according to the session identifier, the first storing step including storing a first subsession identifier for the first user, and storing a second subsession identifier for the second user.

47. (NEW) The system of claim 46, wherein the second means is configured for selectively executing respective web-based voice application operations independently for the first and second users based on respective HTML requests received from the first and second users and the first and second application state stored in the data record.

Amendment filed August 26, 2004 Appln. No. 09/538,899

Page 19

48. (NEW) The system of claim 47, wherein the second means is configured for executing a selected voice application operation for requesting bridging of the first and second users based on a prescribed HTML request received from the second user, the method further comprising third storing in the data record a third application state for the first and second users specifying the bridging.

49. (NEW) The system of claim 48, wherein the second means is configured for executing a second selected voice application operation for requesting disconnection of the bridging based on a second prescribed HTML request received from an HTML browser serving one of the first and second users and the stored third application state, the second means configured for storing in the data record a fourth application state for the first and second users specifying the disconnection of the bridging.

50. (NEW) The system of claim 49, wherein the second means is configured for selectively executing a second group of respective web-based voice application operations independently for the first and second users based on respective HTML requests received from the first and second users and the fourth application state stored for the first and second users in the data record.

Amendment filed August 26, 2004 Appln. No. 09/538,899

Page 20

- 51. (NEW) The system of claim 38, wherein the second means is configured for controlling write access to the data record by one of the first and second application instances based on a prescribed read/write protocol.
- 52. (NEW) The system of claim 38, wherein the second means is configured for:
 terminating the first application instance based on completion of the first web-based voice
 application operation by the first application instance; and

terminating the second application instance based on completion of the second web-based voice application operation by the second application instance.
